

Bayesian Learning and KNN

This concise module is designed for AI-agent based learning and quick revision.

Bayes Theorem

Calculates conditional probability using prior knowledge.

Naive Bayes

Assumes features are independent and is effective for text classification.

K-Nearest Neighbors

Predicts using the majority class among nearest neighbors.

Distance Metrics

Euclidean and Manhattan distances are commonly used.

Choosing K

Small K may overfit; large K may underfit.

Advantages

Simple, effective and easy to implement.

Limitations

Sensitive to irrelevant features and large datasets.

Quick Revision: Revise definitions first, understand key concepts, then practice MCQs.
